

The Kelly Radionic Analyzers

Kelly Research Technologies is proud to offer a full line of experimental variable-capacitance radionic analyzers for use in detection, assessment and balancing of the in-phase and phase-reversed scalar frequencies that define the physical shape of our universe. All Kelly analyzers utilize custom-made parallel plate mechanical capacitors that physically resonate with the scalar wavelengths being detected and transmitted, ensuring 100% analog signal processing. With all harmonic, resonate and phase conjugate waveforms remaining bundled to the core signal, KRT radionic instruments deliver the sensitivity to match the abilities of the user.
