View from the Dome

Dear Family, Friends, and Fellow Researchers,

Exciting news! We are very pleased to announce the launch of our web site: www.kellyresearchtech.com! While our site is still in the fledgling state, we intend to continue to grow this Internet presence, adding information useful to the subtle energy researchers, connections to other members of the radionics/psychotronics community and, of course, to showcase the entire line of products offered by Kelly Research Technologies. Do you want to see the complete list of books we offer, or peruse our inventory of essential oils? Visit our web site! Indeed, through this site we hope to make our resources, products and information available to, well... EVERYONE! Bold statement? Yes, perhaps, but the simple fact of the matter is that we've entered a golden age of communication. The Internet is finally getting to the point of truly being an unlimited resource for transmission of ideas and interpersonal communication thanks to the fact that there are practically no financial or logistical barriers to impede that communication. Anyone with access to a computer can get their ideas out there for literally everyone else in the world to see.

This month we are also excited to spotlight the work being done by our old friends the Larsens at Little Farm Research. In addition to reprinting Lutie Larsen's seminal 1986 article **Radionics and Gardening** from our own *Psychotronics Book 1: Ideas and Innovators*, we are spotlighting the addition of four wonderful booklets to our bookstore. Authored by Katherine Larsen, these booklets cover four fundamental topics of interest to any subtle energy researcher and are an absolute treasure trove of information. They are very reasonably priced, too, so there is no reason not to add these booklets to your library if you have not done so already.

Also up this month, a close look at Kelly Research Technologies' **Experimental Anapathic Purifier**. This unit is an absolute powerhouse, and in the hands of trained operator it can really change the way you attack contamination in uniform compounds or organic systems, such as water, crops and practically anything you would store in a silo. Find out if the KRT Experimental Anapathic Purifier is right for your operation on page 6.

On page 7 we return to our ongoing series of practical weather survival strategies with a look at floods. Most of us think we will never see a rowboat float down the middle of our street, but in the last 15 years we have all seen *major* floods covering huge sections of the United States - all the way from New Orleans to North Dakota. The Midwest flood of 1993 created a body of water as large as a sixth Great Lake! This article also covers the danger of flash floods, which can happen practically anywhere, anytime. Like my Dad the old Boy Scout used to say – **Be Prepared!**

Finally, we spend a little time talking about **focused intent** and its parallels in other areas of daily life.

Warmest Wishes Always,

OUR MISSION is to put top quality scalar and phase conjugate technology in the hands of the vast community of radionic, psychotronic and other "subtle energy" researchers and practitioners.

Radionics and Gardening by Lutie Larsen

Our primary goal in gardening is to learn, and to teach our children, respect for the earth and the life it supports. We try to understand and practice stewardship in every aspect of our lives, home, family, flocks, and fields.

Second, we strive to be as self-sustaining as possible while still interacting with our community. With a family of 12 my husband and I, eight boys, and two girls a garden is a necessity for self-sufficiency. We eat the fruits in season and freeze and dry the surplus. I previously canned much of our food, but now prefer the food value-retaining quality of frozen or dehydrated produce. And even in the middle of winter, at least 50% of our diet comes from fresh garden vegetables. In addition to our main vegetable garden, we have two orchards of peach, apple, and cherry trees; a grove of walnut, almond, and filbert trees; berries and grapes; and a feed garden and an alfalfa crop for our animals. Our livestock includes chickens, ducks, rabbits, bees, and a few cows.

Our 1985 main garden consists of a 55' x 100' plot of eight 85' North-South raised beds and two 50' east-west raised beds. Small trenches, used for composting or for sheltering nursery plants, run alongside each North-South bed. A squash area (containing spaghetti, zucchini, acorn, and crookneck varieties), a grape arbor, tomato and potato boxes, a celery bed, and sage and eggplant plots form the western border of the garden. The eastern edge is made up of herbs and naturally growing plants: nettles, peppermint, bamboo, parsley, Comfrey, horsetail, Jerusalem artichokes, and purple loosestrife.

THE PLAN — Much of our garden's success is due to an organized system of rotating beds and succession planting. Let me give some examples of what we're doing this year (1985). We started with three early vegetable beds. When the spinach and peas are picked, the vines will be used to side-dress the early corn, some of which is planted in trenches as well as in the beds. In May, cantaloupe, honeydew melons, and watermelons will be inter planted with the corn, and by the time they start to spread, the adjacent beds will be free to provide runner room. When the corn is ready to harvest, the stalks will be pulled and fed to the cows and chickens, and a fall crop of beans will go into the beds. A summer planting of beets will occupy the trenches alongside some of the bean beds, and will provide fall greens. After we harvest the early peas and carrots in another bed, we will plant a wide variety in a small area, so I can just nip right out before dinner and cut everything I need for a salad from one bed. There are leaf crops (spinach, lettuce, summer savory) root crops (beets, onions, carrots, radishes, green onions, turnips), cold crops (cauliflower, broccoli, cabbage, Brussel sprouts), fruiting and leguminous crops (peas, beans, cucumbers, peppers, patio tomatoes), sprouts (sunflowers, buckwheat, wheatgrass, oats), and lots of herbs. Most of these crops can be replanted during the summer to provide a steady supply. In the late fall, the beds will be planted in peas for an early crop next spring. Another fall planting will be of early spring greens. This will go in the trench next to the bed that now holds tomatoes, basil, and parsley.

SPECIAL TECHNIQUES — One of our special techniques is to compost all of the plant material in the trenches beside the beds rather than in a separate compost pile. This way, the compost is easy to make and readily accessible. We throw all the weeds into the trenches, and once a week we fill the remaining

Kelly Research Report is published by Kelly Research Technologies, Post Office Box 128, 121 Oasis Road, Lakemont, Georgia, 30552. EDITOR-IN-CHIEF: Ed Kelly. *Kelly Research Report* is published bimonthly. Copyright in the United States. Reproduction in whole or in part is forbidden unless written permission has been granted by the publisher. Annual subscription rate is \$25.00 in North America, \$40.00 (U.S. Dollars) else where. Single copies and back issues are \$5.00 each. Correspondence and subscription requests should be sent to *Kelly Research Report* at the above address. Expiration date for a subscription is shown in brackets following the subscriber's name on the address label. Publication of this newsletter in no way constitutes a claim that psychotronic, radionic or scalar technology devices are effective in the treatment of disease or other human ailments. These devices are designed to be used for personal research and/or agricultural purposes only. We are not in the business of treating people and/or teaching to treat people to treat people. Persons with mental or physical illnesses should be referred to qualified medical practitioners licensed by federal, state or local agencies. space with any other plant residue, as well as cuttings from the many Comfrey plants. The greens are chopped up with a shovel and tilled or turned under to begin the composting process. Then, for the next three to five days, the trenches are watered and turned each morning and evening. The result is lovely and quickly made compost. We also add barnyard manure and soiled litter to some compost trenches each year for a slow-curing but even better product. This year we'll make manure compost in two of the trenches and weed compost in two others.

P.S. July 1985: So far our production has been amazing. In fact, we took video pictures of the plot because it was so unbelievable! At the time of this writing, seven spaghetti squash have produced 80 fruits; each potato plant we've dug has 15 to 18 pounds of potatoes, many of which measure 9 to 10 around, with no hollow centers; and the cherry tomatoes hang in huge grapelike clusters. I attribute the vitality of the plants and the pest and disease free conditions of the garden to one of the more controversial methods in agricultural research today: radionics.

RADIONICS — The study of radionics/psychotronics in agriculture has developed enormously over the past ten years. Radionics is based on the theories that (1) all matter radiates electromagnetic waves, known in the science world as NMR (neutron magnetic resonance) and EMR (electronic magnetic resonance), and (2) the radiation's emitted by different matter (plants, insects, organisms) can be detected and selectively measured. A radionic tuner is a remote-control electronic device that uses electromagnetic frequencies to produce profound physical and chemical changes within an organism. Much of the work in radionics has centered around pest control, in which certain vibrations that will disturb and destroy the growth of a particular insect are introduced into a specific area of cropland (often by treating a photo of the plot). The research that's been done in the past few years has pointed out that there are basic natural energies, and the key to good agriculture lies in working with these energies. For example, anything that distorts the naturally occurring electromagnetic flows through the land will also affect the plants growing on that land. The idea is to balance the electromagnetic flows in the earth and support plant growth with vibrations that encourage plant vitality.

Now where do I come in on all of this? My interest in radionics began as I better understood companion and succession planting. As I watched the plants more carefully, I realized that they affect one another and that there seemed to be fields of energy around each plant and its root system. About this time I was introduced to the principles of biodynamic/French-intensive gardening and matrix planting. The garden became my personal laboratory and Mother Earth my teacher. When I was later invited to speak about my gardening techniques at the United States Psychotronics Association convention, I discovered that my radiant gardening ideas closely followed those of radionics.

My techniques include using magnets to polarize seeds...orienting my transplants (using the pendulum method) to reduce shock...spraying the plants with bug juice (a blend of undesirable pests)...string a copper wire antenna in a North-South orientation above a row of plants to attract and focus energy on the plants...and placing stone pillars on the north and south ends of the garden to help create an energy flow through the garden. Another technique I use is watering new plants with a strong, jelly-like mixture of Comfrey tea. The Comfrey stimulates growth and the jelly-like quality holds the water close to the roots. I purchased a radionic tuner for \$650 in 1981, and since then I have used it to electronically treat the transplants to prevent shock or to stimulate plant growth. By introducing vibrations that balance the electromagnetic flows around the plants, I am able to sustain vigorous growth in the plants and thus discourage pests from attacking. For me, radionics has been an ideal, practical means for becoming a true steward of my land.

Author Spotlight: Little Farm Research's Instructional Booklets

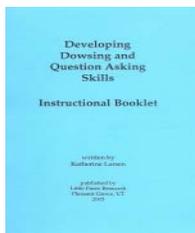

Little Farm Research is a full-scale research farm that has been applying the science of vibration and intent through radionic instrumentation for more than 12 years. They have been well-known, highly respected educators and trainers in the field of radionic agriculture for many more years than that! As such, each of these instructional booklets is a treasure trove of information developed through a balance of academic research, scientific experimentation and decades of hands-on experience.

Kelly Research Technologies is pleased to offer these booklets for just \$8.00 each. Order all four before 10/31/2006 and we will pay the postage!

A History of Radionics by Katherine Larsen

This booklet includes: Development of Radionics Timeline, Three Key Researchers, Other American Researchers, Other British Researchers, Different Rate Systems, and Examples of Instruments. (5 ½" x 8 ½" – 22 Pages)

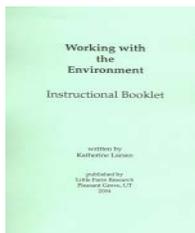

Developing Dowsing and Question Asking Skills by Katherine Larsen

This booklet includes: The History of Dowsing, What is Dowsing?, How do You Dowse?, Dowsing for Radionic Instruments, How to get a Stick, Skill of Asking Questions, Best Way to Ask a Question, Exercises for Better Questions. (5 ½" x 8 ½" – 22 Pages)

Reagent Instructional Booklet developed by Little Farm Research

This booklet includes: What is a Reagent?, What to do with Reagents?, How are Reagents used?, Specific Exercises with Reagents, Reagent Sets Available from Little Farm Research. (5 ½" x 8 ½" – 18 Pages)

Working with the Environment by Katherine Larsen

This booklet includes: Indoor, Home, and Outdoor Environments; Working with Light; Times of Day, Elements of Nature; Environmental Stress; Miasms and Harmful Chemicals. Rates pertaining to the Environmental Issues for the Variable Capacitor Tuner are included. (5 ½" x 8 ½" – 22 Pages)

For more information on the fantastic work being done by Little Farm Research please visit their web site at: www.littlefarmresearch.com.

Since 1985 the Kelly Experimental Anapathic Purifier has been utilized by farmers and subtle energy researchers to deliver systematic signal reversal and General Vitality modification through its unique role as a fixed signal scalar wave generator. While the Kelly Agricultural Analyzers variable plate capacitors allow analog detection and transmission of an infinite combination of scalar wavelengths, the Experimental Anapathic Purifier blasts out a single waveform: the rate we call 0-100.

Setting the rate on a Kelly Agricultural Analyzer or Potentizer to 0-100 has the effect of turning it into a scalar mirror; the sum of the energies of whatever is placed in the input well is broadcast back to the source, but 180 degrees out of phase. **The effect is to immediately begin to lower the general vitality of every detectable scalar wavelength (rate) found in that specimen through wavelength cancellation.** The Experimental Anapathic Purifier's 0-100 scalar transmitter is embedded inside an orgone energy accumulator that acts as a scalar amplifier and signal density multiplier. The end result is a much brawnier scalar transmitter that can be used to quickly reduce even the worst contamination in water, grain, soil or in certain circumstances, even entire crops.

Consider water. Harmful levels of impurities in water are measured in parts per million or even parts per billion, mere drops in a gallon of water. On the energy level, their scalar wavelengths make up a tiny but poisonous fraction of the overall energy signal that makes up that gallon of water. As the general vitality (energy level) of each off the water's components drop due to the signal-canceling effect of the Experimental Anapathic Purifier, the weaker impurities will be snuffed from existence as their vitality levels drop below detectable levels. However, **because ALL of the specimen's vitality levels are being lowered simultaneously, careful management of the processing time is absolutely essential when using the Experimental Anapathic Purifier.** Left too long, the Experimental Anapathic Purifier will continue to reduce the energy level of the water long after the impurities have been removed, eventually rendering it dead, lifeless and useless to plants or animals.

Used carefully, the Experimental Anapathic Purifier can be an easy-to-use and powerful tool for purification or decontamination of compounds or organic systems of a relatively uniform nature:

- One farmer used his Kelly Agricultural Analyzer to test water drawn from multiple wells on the property when water from a single central well was being processed using the Experimental Anapathic Purifier; he reported that the energy levels of the water in the aquifer were being impacted for a half-mile radius.
- An independent subtle energy researcher whose home was tied to a municipal water system used a specimen from the faucet and a photo of the town's water tower to surreptitiously improve the quality of the drinking water for the entire town!
- *Many* operators regularly manage the quality of the grain, seed and product in their silos, attacking mold, bacteria and other contamination at the scalar level.

Using the Experimental Anapathic Purifier is like using a sledgehammer on a specimen due to its universal cancellation of the specimen's total scalar signal. The impact of this tool is most significant when the contamination has been clearly identified, allowing use of a sample of that contaminant to generate and broadcast a cancellation wave directly back to that specific element. For example, one farmer we know sprayed a drum of the wrong herbicide over a section of the crop. Immediately processing a sample of that exact herbicide in the Experimental Anapathic Purifier allowed rapid cancellation of the herbicide's energy signature such that no damage was done to the plants. Of course in most cases there is not such clear evidence as to the exact nature of the contaminant. **Using a Kelly Analyzer to conduct a comprehensive analysis of you specimen can allow you to attack the "cause behind the cause" with surgical precision.** If lead is detected in the water, a sample of lead can be placed in the input well of the Experimental Anapathic Purifier and directly attacked.

Of course the Kelly Analyzer can be used to produce rate-by-rate purification of a specimen. Placed in an auxiliary well connected to the Experimental Anapathic Purifier through the output jacks, **the purified specimen can serve as an automatic balancer for the water, grain or soil represented by the specimen placed in the Experimental Anapathic Purifier's primary input well.** A letter from an early user to my Dad reflects exactly those results:

January 5, 1985

Dear Peter,

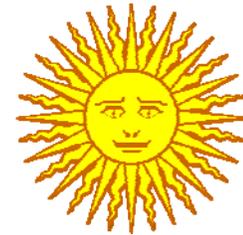

We want to thank for letting us use your new instrument (the Anapathic Water Purifier) on our farm. In getting back from Kansas City, we could see no visual difference in our soil. However, about a week ago we had a very hard rain and this was when we could see a difference. First, there was virtually no run-off or erosion. Second, there was a foaming action on parts of the fields which I think was from the excess salts that were broken loose in treating with your instrument. Third, we can see a slight color change from what used to be brown soil to more of a black color soil. We are enclosing an analysis sheet on our soil and hope that this information will aid you in determining the appropriateness of this instrument on soils.

In God's Love,

Jeff and Denise

Soil Analysis of Energy
Readings after 30 Days

Circulation (air)	22,750
Circulation (water)	29,800
General Vitality	1,090

A Word on Training: Advanced training is essential for the safe and effective use of an Experimental Anapathic Purifier. Completion of Experimental Anapathic Purifier-specific training will ensure that the operator has been exposed to many of the other strategies that will maximize the effectiveness of this essential investment, minimize the risk of incorrect use, and allow the operator to talk one-on-one with the trainer about the specific conditions they are experiencing at their farm or in their research.

The Kelly Experimental Anapathic Purifier \$975.00

We have a limited number of the old Experimental Anapathic Purifier faceplates labeled "Dimensional Sciences" still left in our new parts inventory. Help us clear out the last of these units!

CLOSE-OUT SPECIAL: \$899.00 (while supplies last)

As with all Kelly Research Technology's products, there is a full money back guarantee on the Experimental Anapathic Purifier. Ship it back to us undamaged within 30 days and we will refund your money, no questions asked.

A spoonful of honey: A spoonful of sugar may make the medicine go down, but a spoonful of honey may be a remedy all its own!

- Honey is rich in vitamins and minerals.
- Locally-produced honey may help supplement your resistance to local allergens.
- Honey has a low pH and is relatively acidic. These characteristics can prevent growth of many infection-causing bacteria, making honey useful for dressing wounds, burns and skin ulcers.
- Honey is SO sweet and tasty!
- **Warning:** Honey should never be given to infants due to the risk of bacterial botulism.

This Northeast Georgia honey-lemon tea recipe is a Kelly family favorite for breaking fevers and soothing coughs:

1. Halve two lemons and squeeze juice into a saucepan containing two cups of water.
2. Drop whole lemon rinds into saucepan.
3. Bring mixture to a boil.
4. Pour resultant lemon tea into mug, add a liberal amount of honey to taste*.
5. Drink the tea while nice and hot.

*Sometimes we also sneak in a shot of brandy!

WEATHER ALERT: *Floods!*

As Hurricane Katrina taught us, flooding can utterly destroy an area, with significant loss of life, injury and property damage. In fact, ninety percent of all natural disasters that are formally designated by the President of the United States include flooding¹. In most cases flooding is the result of the wrong combination of rainfall intensity and duration, though oceanic flooding due to hurricane storm surges, undersea earthquakes, and undersea volcanic eruptions can deliver some of the most catastrophic destruction possible without rain playing a significant factor. The following classes of floods are most common:

River floods are formed when continuous rainfall causes a river or lake to overflow its usual boundaries causing submersion of adjacent land. Factors contributing to river floods can include failure of dikes, levees or other engineered structures designed to hold the body of water within its usual banks. River floods typically provide the longest period of advanced warning. If at all possible, evacuate the area completely and retreat to higher ground. Before leaving your home turn off the electricity at the main breaker panel and turn off the natural gas or propane at the main supply valve. Plugging sink, bathtub and toilet drains with plugs or stoppers may prevent raw sewage from backing up into your home where it can create a significant health risk and cleanup nightmare.

Flash floods are caused when more water is deposited onto an area than the ground or local storm sewers can absorb. Flash flooding can be extremely localized due to the tendency of rainwater to continually move toward the lowest point in the area. The flash flood photographed here was caused by just 1.5" of rainfall². Flash floods can be extremely dangerous; in the United States flash floods are the number one cause of weather related death, with half of those fatalities automobile related³. In the event of a flash flood, head immediately to higher ground. Do not attempt to cross a flooded area! In addition to causing you or your vehicle to be washed away, the water may hide submerged hazards or washed out roads. Flash floods may also trigger inescapable landslides or mudslides.

Tsunami are generated when water is displaced due to an underwater earthquake, eruption, explosion or meteor impact. The resultant wave will move in all directions like ripples on a pond. But while this wave may only be three feet tall at sea, it can grow radically in height as it "piles up" against the shoreline, reaching as much as 100 feet tall and moving in excess of 500 miles per hour. The 2004 Indian Ocean tsunamis were responsible for the deaths of 230,000 people over thousands of miles of coastline⁴. Because of their speed and incredible violence, in the event of tsunami you should flee immediately to higher ground by any means possible. Signs of possible arrival of tsunami can include the inexplicable retreat of the water away from the shoreline, as well as the sudden movement of birds and animals to higher ground⁵.

Exploring Focused Intent

“Focused intent” is simply the trained operator’s desire to achieve a particular outcome given a particular set of conditions. As such, the focused intent of the human operator lies at the heart of all radionic instrument, devices, and ideas. Consider the following examples of focused intent in action:

RADIONIC INSTRUMENTS: Intent is initially focused when the operator takes the photo or gathers the specimen to be analyzed – the operator has a desire to understand more about the specimen so that he or she may then make improvements at the energy level. When conducting the analysis the operator then “focuses” the scalar instrument on a whole worksheet of known frequencies/rates; one by one the energy levels in the specimen are tested against the known frequencies, assessed as the operator turns the dial and rubs the plate. The most critical element of focused intent during this phase occurs in the stillness in the mind of the operator, the moment when the daily chatter falls quiet to reflect only on that internal energy resonance that manifests as the “stick” on the rub plate. At that point where the “stick” is most strongly felt the operator is physically in resonance with the intent in his or her mind, vis a vis the specimen and the desired outcome, literally the point at which the circuit becomes complete between all of these elements. More simply stated, the “stick” is the point at which mind meets matter.

RADIONIC DEVICES: A classic and ancient example is found at the walls of ancient Jericho, where the trumpets of Joshua’s Priests brought the walls crashing so famously down. Let’s take a closer look at Joshua 6:8-11 and see what other elements were at play:

8 And it was so, that when Joshua had spoken to the people, the seven priests carrying the seven trumpets of rams’ horns before the LORD went forward and blew the trumpets; and the ark of the covenant of the LORD followed them. 9 And the armed men went before the priests who blew the trumpets, and the rear guard came after the ark, while they continued to blow the trumpets. 10 But Joshua commanded the people, saying, “You shall not shout nor let your voice be heard, nor let a word proceed out of your mouth, until the day I tell you, ‘Shout!’ Then you shall shout!” 11 So he had the ark of the LORD taken around the city, circling it once; then they came into the camp and spent the night in the camp.

In the verse we are reminded that not only do we have the priests blasting out specific frequencies on the trumpets during the first of seven circuits around the exterior of the city, but also that the accompanying soldiers were given strict instructions not to disrupt or alter the trumpet frequencies with even a word from their own mouths. Next we are reminded that the trumpeters were being closely followed by the bearers of the mysterious Ark of the Covenant, believed by many to be one of the most powerful scalar energy amplifiers ever wrought by human hands using the very detailed instruction provided by the LORD in Exodus 25. Finally we have the giant, unified shout of the soldiers who marched ahead of and behind the trumpets and the Ark. Their primal roar of human energy could have served as the act of focused intent that completed this giant scalar energy circuit with such explosive results.

RADIONIC IDEAS: As Colonel Thomas Bearden so famously explained, the only difference between thinking about an object in your mind and holding that object in your hand is the relative strength of their scalar wavelengths/frequencies. The frequencies of a water nutrient and the *idea* of that same water nutrient are the exactly the same, and they both have a presence in the dimension of time. The “imaginary” water nutrient just has such a low general vitality that it cannot be measured in the standard experimental range, perhaps mere fractions of one unit on the intensity dial of a Kelly Analyzer. Amplified or unamplified, the operator’s mental focus on this nutrient can cause it to grow in power until the kindling point is reached and that nutrient comes to exist in our world in a physical, measurable way. This is the reason that prayer, meditation and old fashioned positive thinking can have real world impact on a person’s life. After all, what is a prayer or a positive thought if not a technique for focusing the intent of the human to achieve a particular outcome given a particular set of conditions?

Ironically, the most lyrical metaphor for the circuit formed between the radionic operator, a frequency generator, a scalar frequency amplifier, and the operator’s focused intent may be the following poem from the fictional *Star Wars* universe, in which the relationship between a Jedi Knight, his lightsaber’s activating crystal, the Force (the energy source that amplifies his will) and his focused intent is described:

*The crystal is the heart of the blade.
The heart is the crystal of the Jedi.
The Jedi is the crystal of the Force.
The Force is the blade of the heart.*

*All are intertwined: The crystal,
The blade,
The Jedi.*

All are one.
